

Cybersecurity Incident Report

Scenario:

You work as a security analyst for a travel agency that advertises sales and promotions on the company's website. The employees of the company regularly access the company's sales webpage to search for vacation packages their customers might like.

One afternoon, you receive an automated alert from your monitoring system indicating a problem with the web server. You attempt to visit the company's website, but you receive a connection timeout error message in your browser.

You use a packet sniffer to capture data packets in transit to and from the web server. You notice a large number of TCP SYN requests coming from an unfamiliar IP address. The web server appears to be overwhelmed by the volume of incoming traffic and is losing its ability to respond to the abnormally large number of SYN requests. You suspect the server is under attack by a malicious actor.

You take the server offline temporarily so that the machine can recover and return to a normal operating status. You also configure the company's firewall to block the IP address that was sending the abnormal number of SYN requests. You know that your IP blocking solution won't last long, as an attacker can spoof other IP addresses to get around this block. You need to alert your manager about this problem quickly and discuss the next steps to stop this attacker and prevent this problem from happening again. You will need to be prepared to tell your boss about the type of attack you discovered and how it was affecting the web server and employees.

Section 1: Identify the type of attack that may have caused this network interruption

One potential explanation for the website's connection timeout error message is that the server was getting overwhelmed by SYN requests. The logs indicate that traffic was normal until a single IP address started sending an irregular amount of SYN requests, suggesting that this event could be a direct Denial of Service (DoS) attack.

Section 2: Explain how the attack is causing the website to malfunction

When website visitors try to establish a connection with the web server, a three-way handshake occurs using the TCP protocol. The first step is the SYN (synchronize) packet, where the sender requests a connection to the server. The second step is the SYN-ACK (synchronize-acknowledgment), where the server acknowledges the sender's packet and sends its own packet back while reserving system resources. The final step is the ACK (acknowledgment), where the sender transmits an ACK packet back to the server to complete the handshake process and allow the connection.

When a malicious actor sends a large number of SYN packets all at once, they flood the server with requests but never send the final ACK packet needed to complete the handshakes. This causes the server's reserved resources to be taken up, ultimately exhausting its capacities.

The logs indicate that network traffic initially runs normally and the server responds to regular clients. However, after the malicious actor starts to flood the server with SYN packets, the server becomes overwhelmed and unresponsive to regular clients altogether.

Summary and recommendations:

This incident showcases Wireshark network traffic logs of a company site, which becomes flooded with SYN packets from a single IP address. This caused the server to eventually get overwhelmed with the connection requests from the source IP and forces the server to become unresponsive to regular client traffic. This could slow down company operations because employees will not be able to access the site; and negatively affect sales associated with the website, ultimately costing the organization money and negative reputation, which in turn can lead to a drop in share value.

The next best course of action would be to secure the site with SYN cookies, which can help reduce strain on the server to prevent incomplete TCP handshakes. Another method to stack on top of the SYN cookies could be to configure a firewall to cap out the amount of SYN requests in a given time frame (rate limiting).

Logs:
